

Test results geldvoorjespel.nl phase 1

Overall

- * We see that some of the texts are in the admin settings but other texts are hardcoded in the HTML. Can you make sure that all texts are maintainable in the admin settings?
- * Also with regards to the multi language. We see two categories in the admin settings for Label CMS and Message CMS. Can you merge these into one list? Also, we would like to see you use more specific ID's for the texts. Usage of the 'msg' prefix for messages is good, we would like to see that used for everything. So a 'lbl' prefix for text labels, 'frm' for form labels, 'btn' for button texts, etc.
- * The index page of the seller pages should initially only show the dropdown with consoles and the search bar. After searching the other elements should be shown.
- * The footer is not the same on every page. Please revise this so that the same footer is used everywhere.
- * Feedback messages like 'Seller details updated successfully' should be displayed according to the message-to-user specifications. They should be shown in the place where the 'Items in cart' placeholder is now. You can remove the 'Help' and 'About' links to make more space for this.
- * Sessions for buyers and sellers are not completely separated. When I log in as a buyer, I can go to the seller pages and I am still logged in as a buyer. The sessions for the buyer should only be active on the buyer pages.
- * For now it is not really possible for us to test the scraping process. From what we can see in the article database it looks good, but it's possible that some changes have to be done later on.

Admin pages

- * Can you add a 'settings' item in the menu for the admin page? Also, please put feedback messages in the message-to-user area (that currently says ADMIN ACCOUNT)
- * Where is the option to maintain email messages?

Admin pages: sellers (DONE ALL)

- * Can you apply a default sort on ID for admin lists (starting with the newest)?
- * Filtering on seller name does not work correctly. When I filter on 'tania' I see three results but when I filter on 'paul' I see nothing. Can you revise this so that all values containing the search string are displayed (case insensitive)?
- * The table for sellers has no border and the ID's are not underlined so it is not obvious that they are links. Please make this consistent on all pages.
- * The seller list does not show the 'active' field.
- * When we enter a long value as bank account, the entry is cut off after 20 characters. We want to see a form validation error message based on the max length of the field. This does not only apply to this specific field but for everything.

Admin pages: buyers

- * The buyer list does not show the 'active' field. (DONE)
- * Filtering the buyer list does not work properly. The 'filter by seller name' in the mockups was a copy/paste error. Please revise this according to point 3 of Admin_buyers in the written specifications. (DONE)
- * The page for creating a new buyer does not show all fields.
- * Autobid is default set to yes, but this should be solved by correcting the previous point.
- * After saving the changes the user is redirected to the previous page: Admin_buyers (The specs say Admin_invoices but this is also a copy/paste error)
- * The time (00:00:00) is shown in the date field 'Accepting Collection Per'
- * If the date field 'Accepting Collection Per' contains a value, the date picker is not shown when editing.
- * All buyers have a 'Last invoice buying sum' of 621 euros, this should be calculated (later)
- * The commission details show a 'Z' before the euro sign.

Admin pages: articles

- * The table for articles has no border. Please make this consistent on all pages. (DONE)
- * Maintaining alternative titles for games does not work correctly for all articles. For some it does work but for others it doesn't. Also, it looks like on some cases some HTML code is saved with the title (in one case it was '<i>' which caused all subsequent text on the page to turn italic. (DONE)

Buyer pages

- * After a password reset the browser should redirect to the buyer login page
- * A buyer should be able to change his password
- * You can remove the 'Are you the email address of your account password?' link from the login pages
- * All fields are editable in the buyer account details page. This should not be the case, see specs.

Seller pages: registration

- * There seems to be no check whether an email address is already used
- * There is no indication of which fields are required/mandatory
- * Can you add a warning when the user gives to different passwords (in real time)?

* After saving account details in the seller pages there should be a redirect (see point 5 of Seller_register in the specs)

Seller pages: search

* Search is still done only based on the beginning of the title (i.e. if we search on 'potter' there are not results shown instead of all Harry Potter titles).

* Not sure whether alternative names are searched because maintaining the alternative names does not work properly. The search need to apply to all names (not just the default name).

* After selecting a title from the search result the user has to press enter to show the details for that game. The details should be shown immediately after selecting the title.

* Is it possible to disable the submit when the user presses enter while typing in a search term? It might be confusing when a user (for example) types 'mario' and presses enter that Mario Golf is displayed even before the search result list is displayed. This way the user has to manually select the correct game. This is also important to make sure that the user chooses the correct game belonging to the correct console.

* The search results (game details) is not complete yet (ie picture is missing, no alternative names, ...) but we assume that this will be done in phase 2.
